

# Parapsychology in Nature

Parapsychology · Practice Test · 8 Questions

---

**1. Some parapsychological research has investigated if certain animals possess a form of intuition or precognition. Which animal has been frequently studied for its apparent ability to predict natural disasters like earthquakes?**

- A) Honeybees
- B) Dolphins
- C) Elephants
- D) Cats

**2. In parapsychology, the concept of 'psychic healing' is sometimes explored. Which common household pet is often anecdotally reported to sense illness or emotional distress in its owner?**

- A) Hamsters
- B) Parrots
- C) Dogs
- D) Goldfish

**3. Researchers have explored whether plants can respond to stimuli not explained by conventional scientific understanding. Some studies suggest plants might react to human emotions or intentions. What is a common plant studied in these contexts?**

- A) Cacti
- B) Venus flytraps
- C) Sensitive plants (Mimosa pudica)
- D) Ferns

**4. The phenomenon of 'biocommunication' in parapsychology suggests a potential, unexplained link between living organisms. Some research has looked into whether birds can navigate using a magnetic sense. What is this hypothesized navigation sense called?**

- A) Echolocation
- B) Magnetoreception
- C) Thermoreception
- D) Chemoreception

**5. Parapsychological investigations sometimes examine phenomena beyond human perception. Which insect is known for its complex communication methods, and has been studied for potential subtle influences in its colonies that might be explored under a parapsychological lens?**

- A) Ladybugs
- B) Ants
- C) Butterflies
- D) Dragonflies

**6. Some anecdotal accounts in parapsychology involve animals exhibiting unusual awareness of events. Which marine mammals are often associated with complex social structures and are subjects of interest regarding their potential for advanced communication or empathy?**

- A) Sharks
- B) Whales
- C) Jellyfish
- D) Octopuses

**7. The concept of 'remote viewing' in parapsychology, where an individual is purported to perceive distant or unseen targets, has occasionally been explored in relation to animal behavior. Some studies look at animal migration patterns. Which long-distance migrating animal has been observed to consistently find its way home over vast distances?**

- A) Sloths
- B) Penguins
- C) Salmon
- D) Giraffes

**8. In parapsychology, the idea of psychokinesis (PK) refers to mind-over-matter. While largely unproven, some early research involved attempts to influence simple biological systems. Which of these is a simple biological system that has been a subject of some speculative parapsychological research?**

- A) Mineral crystals
- B) Water molecules
- C) Germination of seeds
- D) Volcanic eruptions
