

Introduction to Animal Locomotion and Nervous Tissue

Biology · Answer Key · 4 Questions

1. What is the primary characteristic of locomotion?

- A) Staying in one place
- B) Change in location of an organism**
- C) Growth of body parts
- D) Absorption of nutrients

2. Which of the following is an example of locomotion?

- A) A tree growing
- B) A plant bending toward light
- C) An organism moving from the ground to a classroom**
- D) A cell dividing

3. What is the primary function of nervous tissue?

- A) Storing fat
- B) Collecting and generating impulses**
- C) Filtering blood
- D) Transporting oxygen

4. From which embryonic germ layer does nervous tissue originate?

- A) Endoderm
- B) Mesoderm
- C) Ectoderm**
- D) Epidermis
